

# Health Information Exchange Participation

## Critical Access Hospitals with Clinics

### How Critical Access Hospitals with Clinics are using the health information exchange to improve transitions of care

#### ORGANIZATION PROFILE:

**Community Hospital established in 1904.**

**Organization Type:** Critical Access Hospital, 25 beds.

**Services:** Obstetrics, home health, swing bed and hospice, and a broad range of outpatient services.

**Service Base:** 24/7 critical access care to patients of all ages in small rural community.

#### HEALTH INFORMATION EXCHANGE USE:

**Streamlines care delivery across healthcare settings:**

Timely access to more complete patient data helps streamline care delivery and coordination across all settings, to include the emergency department, primary care physician's office, specialty clinics, and skilled nursing homes even when providers and facilities are using different EHRs.

**Provides timely access to patient information:** Using the health information exchange to track demographics, admissions, discharges, transfers, progress notes, diagnosis, lab results and medications delivers a more comprehensive picture of patients' health to members of the healthcare team.

**Saves time and eliminates redundancy:** By having access to a patient's more complete longitudinal record, the redundant testing, x-rays, and imaging can be avoided. This helps to save time and money while positively impacting patient safety.

**Supports medication reconciliation:** Better adherence to prescription and treatment plans while avoiding over-prescribing of medication or undetected potential adverse drug interactions.

#### HEALTH INFORMATION EXCHANGE EXPLAINED:

HIEs efficiently store patients health care information digitally and securely shares the information among physicians, nurses, and other health care providers in a timely manner.

HIE utilization may improve patient care coordination and transitions of care by allowing access to patients' most recent test results, procedures, diagnosis, medications, allergies and more.

SHINE of Missouri is a physician-led HIE delivered in partnership with Missouri State Medical Association and a member of the KAMMCO Network. KAMMCO offers interoperability and analytics products and services in seven states to include Kansas, Georgia, South Carolina, Connecticut, New Jersey, Missouri, and Louisiana. Use cases are developed based upon information provided by HIE participants in these states.

To learn more about SHINE of Missouri, call 844.424.4370 or visit [www.SHINEofMissouri.com](http://www.SHINEofMissouri.com).

#### Utilizing the health information exchange to improve transitions of care:

*"Our facility is actively working to improve the transitional care process for patients, whether they are being transitioned from one level of care to another, transferred outside of our care, or coming into our care. Currently we focus on using KHIN to obtain information for swing bed and home health referrals so we can be better prepared for their admissions. This translates into improved quality of care for all patients by leveraging the HIE information in real time rather than awaiting a fax that may not be received in a timely manner."*
